<ol> <li>Give the students practice in modelling parallel systems in a formal framework.</li> <li>Give the students skills in analyzing behaviours of reactive systems.</li> <li>Introduce algorithms and tools based on the modelling formalisms.</li> </ol>	<ul> <li>Nontermination is bad!</li> <li>In case of termination, the result is unique.</li> </ul>	<ul> <li>Mobile phones?</li> <li>Vending machines?</li> </ul>		
Lecture 1 () Semantics and Verification 2008 10 / 28	Is this all we need? Lecture 1 () Semantics and Verification 2008 11 / 28	Lecture 1 () Semantics and Verification 2008 12 / 28		

### Reactive systems

Characterization of a Reactive System **Reactive System** is a system that computes by reacting to stimuli from its environment.

#### Key Issues:

communication and interaction

parallelism

### Nontermination is good!

The result (if any) does not have to be unique.

Lecture 1 ()

Semantics and Verification 2008

Classical vs. Reactive Computing

	Classical	Reactive/Parallel	
interaction	no	yes	
nontermination	undesirable	often desirable	
unique result	yes	no	
semantics	$states \hookrightarrow states$	?	

# Analysis of Reactive Systems

Questions

How can we develop (design) a system that "works"?How do we analyze (verify) such a system?

Fact of Life Even short parallel programs may be hard to analyze.

# Lecture 1 () Semantics and Verification 2008

How to Model Reactive Systems

### Question

What is the most abstract view of a reactive system (process)?

Answer

A process performs an action and becomes another process.

## The Need for a Theory

## Conclusion

We need formal/systematic methods (tools), otherwise ...

- Intel's Pentium-II bug in floating-point division unit
- Ariane-5 crash due to a conversion of 64-bit real to 16-bit integer
- Mars Pathfinder

Labelled Transition System Definition A labelled transition system (LTS) is a triple (*Proc*, *Act*, { $\stackrel{a}{\rightarrow}$  | *a*  $\in$  *Act*}) where • *Proc* is a set of states (or processes), • *Act* is a set of labels (or actions), and • for every *a*  $\in$  *Act*,  $\stackrel{a}{\rightarrow} \subseteq$  *Proc*  $\times$  *Proc* is a binary relation on states called the transition relation.

mantics and Verification 2008

We will use the infix notation  $s \xrightarrow{a} s'$  meaning that  $(s, s') \in \xrightarrow{a}$ .

Sometimes we distinguish the initial (or start) state.

Sequencing, Nondeterminism and Parallelism	Binary Relations	Closures		
LTS explicitly focuses on <b>interaction</b> . LTS can also describe: • sequencing $(a; b)$ • choice (nondeterminism) $(a + b)$ • limited notion of parallelism (by using interleaving) $(a  b)$	Definition A binary relation R on a set A is a subset of $A \times A$ . $R \subseteq A \times A$ Sometimes we write x R y instead of $(x, y) \in R$ . Properties • R is reflexive if $(x, x) \in R$ for all $x \in A$ • R is symmetric if $(x, y) \in R$ implies that $(y, x) \in R$ for all $x, y \in A$ • R is transitive if $(x, y) \in R$ and $(y, z) \in R$ implies that $(x, z) \in R$ for all $x, y, z \in A$	<ul> <li>Let R, R' and R" be binary relations on a set A.</li> <li>Reflexive Closure</li> <li>R' is the reflexive closure of R if and only if</li> <li>I R ⊆ R',</li> <li>R' is reflexive, and</li> <li>R' is the <i>smallest</i> relation that satisfies the two conditions above, i.e., for any relation R": if R ⊆ R" and R" is reflexive, then R' ⊆ R".</li> </ul>		
Lecture 1 () Semantics and Verification 2008 19 / 28 Closures	Lecture 1 () Semantics and Verification 2008 20 / 28 Closures	Lecture 1 () Semantics and Verification 2008 21 / 28 Labelled Transition Systems – Notation		
<ul> <li>Let <i>R</i>, <i>R'</i> and <i>R''</i> be binary relations on a set <i>A</i>.</li> <li>Symmetric Closure</li> <li><i>R'</i> is the symmetric closure of <i>R</i> if and only if</li> <li><i>R</i> ⊆ <i>R'</i>,</li> <li><i>R'</i> is symmetric, and</li> <li><i>R'</i> is the <i>smallest</i> relation that satisfies the two conditions above, i.e., for any relation <i>R''</i>: <ul> <li>if <i>R</i> ⊆ <i>R''</i> and <i>R''</i> is symmetric, then <i>R'</i> ⊆ <i>R''</i>.</li> </ul> </li> </ul>	<ul> <li>Let R, R' and R" be binary relations on a set A.</li> <li>Transitive Closure</li> <li>R' is the transitive closure of R if and only if</li> <li>R ⊆ R',</li> <li>R' is transitive, and</li> <li>R' is the <i>smallest</i> relation that satisfies the two conditions above, i.e., for any relation R": if R ⊆ R" and R" is transitive, then R' ⊆ R".</li> </ul>	Let $(Proc, Act, \{\stackrel{a}{\longrightarrow}   a \in Act\})$ be an LTS. • we extend $\stackrel{a}{\longrightarrow}$ to the elements of $Act^*$ • $\longrightarrow = \bigcup_{a \in Act} \stackrel{a}{\longrightarrow}$ • $\longrightarrow^*$ is the reflexive and transitive closure of $\longrightarrow$ • $s \stackrel{a}{\longrightarrow}$ and $s \stackrel{a}{\longrightarrow}$ • reachable states

How to Describe LTS	S?			Calculus of Com	municating Systems		Process Algebra	
Syntax unknown entity programming language ??? CCS		Semantics known entity what (denotational) or how (operational) it comp Labelled Transition System	utes	Insight of Robin Mi	ed "Calculus of Communicating Systems ilner (1989) ) processes have an algebraic structure. $\boxed{P_1} op \boxed{P_2} \Rightarrow \boxed{P_1 op P_2}$	5".	<ul> <li>Basic Principle</li> <li>Define a few atomic processes (modelling behaviour).</li> <li>Define compositionally new operations (b process behaviour from simple ones).</li> <li>Example</li> <li>atomic instruction: assignment (e.g. x:=2)</li> <li>new operators: sequential composition (P<sub>1</sub>; P<sub>2</sub>) parallel composition (P<sub>1</sub>   P<sub>2</sub>) Now e.g. (x:=1    x:=2); x:=x+2; (x:=x-1)</li> </ul>	uilding more complex and x:=x+2)
Lecture 1 ()	Semantics and Verifi		25 / 28	Lecture 1 ()	Semantics and Verification 2008	26 / 28	Lecture 1 () Semantics and Verification 2008	27 / 28

CCS Basics (Sequential Fragment)

- Nil (or 0) process (the only atomic process)
- action prefixing (a.P)
- names and recursive definitions  $\begin{pmatrix} def \\ = \end{pmatrix}$
- nondeterministic choice (+)

This is Enough to Describe Sequential Processes

Any finite LTS can be (up to isomorphism) described by using the operations above.
