Logical Properties of Reactive Systems

Modal Properties - what can happen now (possibility, necessity)

- drink a coffee (can drink a coffee now)
- does not drink tea
- drinks both tea and coffee
- drinks tea after coffee

Temporal Properties – behaviour in time

- never drinks any alcohol
- (safety property: nothing bad can happen)
- eventually will have a glass of wine

(liveness property: something good will happen)

Can these properties be expressed using equivalence checking?

Verifying Correctness of Reactive Systems

Let Impl be an implementation of a system (e.g. in CCS syntax).

Equivalence Checking Approach

$$Impl \equiv Spec$$

- \equiv is an abstract equivalence, e.g. \sim or \approx
- Spec is often expressed in the same language as Impl
- Spec provides the full specification of the intended behaviour

Model Checking Approach

 $Impl \models Property$

mantics and Verification 2008

- |= is the satisfaction relation
- Property is a particular feature, often expressed via a logic
- Property is a partial specification of the intended behaviour

Model Checking of Reactive Systems

Our Aim

2 / 12

Develop a logic in which we can express interesting properties of reactive systems.

3 / 12

Hennessy-Milner Logic - Syntax

Syntax of the Formulae ($a \in Act$)

$$F,G ::= tt \mid ff \mid F \wedge G \mid F \vee G \mid \langle a \rangle F \mid [a]F$$

Intuition:

1 / 12

- tt all processes satisfy this property
- ff no process satisfies this property
- \land , \lor usual logical AND and OR
- $\langle a \rangle F$ there is at least one a-successor that satisfies F
- [a]F all a-successors have to satisfy F

Remark

Temporal properties like *always/never in the future* or *eventually* are not included.

Hennessy-Milner Logic – Semantics

Let $(Proc, Act, \{\stackrel{a}{\longrightarrow} | a \in Act\})$ be an LTS.

Validity of the logical triple $p \models F$ ($p \in Proc, F$ a HM formula)

 $p \models tt \text{ for each } p \in Proc$

 $p \models ff$ for no p (we also write $p \not\models ff$)

 $p \models F \land G$ iff $p \models F$ and $p \models G$

 $p \models F \lor G$ iff $p \models F$ or $p \models G$

 $p \models \langle a \rangle F$ iff $p \xrightarrow{a} p'$ for some $p' \in Proc$ such that $p' \models F$

 $p \models [a]F$ iff $p' \models F$, for all $p' \in Proc$ such that $p \xrightarrow{a} p'$

We write $p \not\models F$ whenever p does not satisfy F.

What about Negation?

For every formula F we define the formula F^c as follows:

•
$$tt^c = ff$$

•
$$f^c = tt$$

$$(F \wedge G)^c = F^c \vee G^c$$

•
$$(F \vee G)^c = F^c \wedge G^c$$

$$(\langle a \rangle F)^c = [a]F^c$$

$$([a]F)^c = \langle a \rangle F^c$$

Theorem (F^c is equivalent to the negation of F)

For any $p \in Proc$ and any HM formula F

①
$$p \models F \Longrightarrow p \not\models F^c$$

2
$$p \not\models F \Longrightarrow p \models F^c$$

Image-Finite Labelled Transition System

Image-Finite System

Let $(Proc, Act, \{\stackrel{a}{\longrightarrow} | a \in Act\})$ be an LTS. We call it **image-finite** iff for every $p \in Proc$ and every $a \in Act$ the set

$$\{p' \in Proc \mid p \stackrel{a}{\longrightarrow} p'\}$$

is finite.

Hennessy-Milner Logic – Denotational Semantics

For a formula F let $\llbracket F \rrbracket \subseteq Proc$ contain all states that satisfy F.

Denotational Semantics: $[] : Formulae \rightarrow 2^{Proc}$

$$\bullet \ [F \lor G] = [F] \cup [G]$$

•
$$[\![F \land G]\!] = [\![F]\!] \cap [\![G]\!]$$

$$\bullet \ \llbracket \langle a \rangle F \rrbracket = \langle \cdot a \cdot \rangle \llbracket F \rrbracket$$

•
$$[[a]F] = [\cdot a \cdot][F]$$

where $\langle \cdot a \cdot \rangle$, $[\cdot a \cdot] : 2^{(Proc)} \rightarrow 2^{(Proc)}$ are defined by

$$\langle \cdot a \cdot \rangle S = \{ p \in Proc \mid \exists p'. \ p \stackrel{a}{\longrightarrow} p' \text{ and } p' \in S \}$$

$$[\cdot a \cdot] S = \{ p \in Proc \mid \forall p'. \ p \xrightarrow{a} p' \implies p' \in S \}.$$

Semantics and Verification 2008

Relationship between HM Logic and Strong Bisimilarity

Theorem (Hennessy-Milner)

Let $(Proc, Act, \{\stackrel{a}{\longrightarrow} | a \in Act\})$ be an image-finite LTS and $p, q \in Proc$.

$$p \sim q$$

if and only if

for every HM formula $F: (p \models F \iff q \models F)$.

The Correspondence Theorem

Theorem

Let $(Proc, Act, \{\stackrel{a}{\longrightarrow} | a \in Act\})$ be an LTS, $p \in Proc$ and F a formula of Hennessy-Milner logic. Then

```
p \models F if and only if p \in \llbracket F \rrbracket.
```

ntics and Verification 2008

Proof: by structural induction on the structure of the formula F.
