Theorem

Player 0 has a (globally) optimally resilient strategy in every pushdown safety game with disturbances.

Note

No longer true in infinitely branching arenas!

Lemma

Let \mathcal{G} be a pushdown safety game with initial vertex v_I . If $r(v_I) \neq \omega + 1$, then $r(v_I) < 2^{|\mathcal{G}|} \cdot |\Gamma|^{2^{|\mathcal{G}|}}$ (not the actual value).

Note

Bound is tight for pushdown and one-counter arenas.

Theorem

The following problem can be solved in triply-exponential time: “Given a pushdown safety game \mathcal{G} with initial vertex v_I , determine the resilience value of v_I ”. Also, an optimally resilient strategy from v_I can be computed in triply-exponential time.

Note

None.

Theorem

The following problem can be solved in polynomial space: “Given a one-counter safety game \mathcal{G} with initial vertex v_I , determine the resilience value of v_I ”.

Note

No strategy computed.

Thank you for watching.
